Microwave Assisted Synthesis and Characterization of Silver Nanoparticles Using Citrullus Lanatus Leaf Extract and Its Anti-Inflammatory Activity Against Human Blood Cells

Abstract: The use of engineered nanomaterials has increased as a result of their positive impact on many sectors of the economy, including agriculture. In the current study, the plant extract of Citrullus Lanatusis used for the synthesis of silver nanoparticles. The plant extract is mixed with AgNO3, and then it is incubated. The extract is kept in microwave oven for exposure of heat, then it is dried and powdered. The synthesized dried powder is confirmed as nanoparticles by color transformation. The characterization of silver nanoparticles was studied by UV–Vis spectroscopy, FTIR, XRD & TEM. The silver nanoparticles synthesized were generally found in size 1-100 nm. The average size of synthesized silver nanoparticles is found to be 15.98 nm using XRD data by Scherrer’s formula, which is approximately similar as the size obtained in TEM Analysis 16.32 nm. In totality, the AgNPs prepared are safe to be discharged in the environment and possibly utilized in processes of pollution remediation. AgNPs may also be efficiently utilized in Anti-inflammatory activity of Pharmaceutical research to obtain better result of plant as shown by our study. The Anti-inflammatory activity of silver nanoparticles was tested on human blood cells which confirms that the plant mediated synthesis of silver nanoparticles have a significant Anti-inflammatory effect on human blood cells.

Performance Assessment of Asphalt Pavement mix Modified by Nano-Silica and Nano-Clay

Abstract: In recent years, Nano Technology started to be utilized in many civil engineering applications and one emphasis was in highway pavements. Nano materials are used to improve the quality and behavior of bitumen in different conditions. This research represents the results obtained from an experimental program designed to study the improvement of asphalt mix characteristics when using nano-materials. In this study, the nano-materials used were nano-silica, kaolinite nano-clay, and montmorillonite nano-clay by percents of (1, 3, 5, 7, and 9%) by weight of bitumen. Rheological properties of nano-modified bitumen namely; penetration, softening, flash point, and viscosity were studied. Furthermore, the mechanical properties of asphalt mixes constructed using nano-modified bitumen were studied, namely: stability, flow, compression stress, modulus of elasticity, and indirect tensile strength. From the results, it was observed that using nano-materials improve the rheological properties of bitumen in the form of decrease in penetration by 26% and increase in softening, flash point, and viscosity by 29%, 8%, and 6% respectively. In addition, nano-modified bitumen improves the mechanical properties of asphalt mix in the form of increase in stability, compressive strength, and indirect tensile strength by 37%, 40%, and 90%. Essentially, the recommended optimum percentages of nano-modified bitumen used in asphalt mix are 7% nano-silica, 9% kaolinite nano-clay, and 9% montmorillonite nano-clay.

Heat Exchanger Rating Models for Isothermal CSTR SO3 Hydration using Vanadium Catalyst

Abstract: This work deals with the development of models for heat exchanger rating in catalytic sulphur trioxide hydration process at isothermal condition exploiting the Abowei and Goodhead derived continuous adsorption tower (CAST) heat generation per unit volume equations at constant temperature. Shell and Tube heat exchanger is invoked for this studies resulting to novel design equations which were stochastically examined and found to be capable of simulating the rating performance dimensions as a function of kinetic parameters. The rating performance models were further generalized to inculcate fractional conversion functionality. The novel design models were simulation to evaluate the overall heat transfer coefficient, mass flow rate of cooling fluid, tube side cross flow area and tube side film coefficient using Matlab R2007B within the operational limits of conversion degree at constant temperature. The heat exchanger is used for the removal of heat generated per reactor unit volume utilizing water as cooling fluid, enters the shell side at 25°C flowing counter to the tube side at exit temperature of 85°C in order to maintaining 97°C isothermal condition. The configuration of the exchanger is U–tube type and is three (3) shell and six (6) tube passes. The results of the rating dimensions showed a dependable relationship with fractional conversion at constant temperature for various reactor radius and number of tubes.

Abstract: Creating a selective pressure during growth of the male gametophyte and selection microspores under selective conditions with obligatory receipt of haploid structures of constant form, that, is doubled haploid lines with given properties is one of the tasks of biotechnology and the goal of our research. Using ABA when pollen haploid breeding the most defensible way since this hormone plays a key role in the response to water stress. Pollen haploid breeding using ABA efficient way also because ABA is a fertility control.
